

GitHub Folder Setup

The Recommended GitHub folder setup is as below.

The folder should be as below

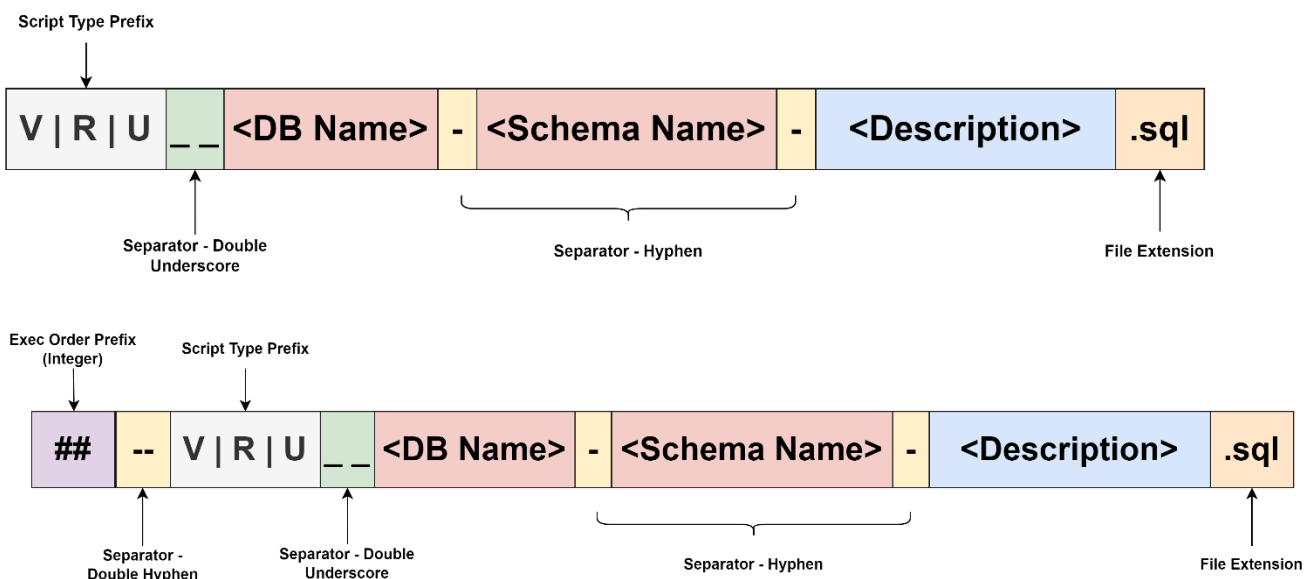

The subfolders should be as below

#Repo Structure Topology

1. Naming standards - DB Scripts

* DDL for Physical Objects (Examples below)

- * V__ODS_FOD_FRED-1-ODS_Objects.sql
- * V__PUBLIC-2-Job_Inventory_Entries_FOD_FRED.sql
- * V__ACC_LEVEL_OBJ-1-Initial_Role_Setup.sql

- * V__ODS_PSCAMS_PEPS_CCO-1-Initial_ODS_Objects.sql
- * V__ODS_PSCAMS_PEPS_CCO-1-Additional_ODS_Objects_TASK2.sql

* DDL for View / Repeatable Objects (Example below)

- * R__BAL_ODS_FOD_FRED-1-BAL_Objects.sql

* Undo Script

- * U__<< rest of the name should be same as orig deploy script>>.sql

2. Ensure the SQL scripts are structured as instructed below,

* Group DB Object definition DDLs / SQL statements by its schema. ****No SQL scripts must have cross schema object definitions combined****

- * All scripts must have SQL statements that refer to the object's fully qualified way .

3. Check in the deploy ready scripts only to **db-scripts-repo/dm/dev**** repo / folder path**

4. Once a script is deployed to higher environment, **do not edit or amend or change**** the script unless it is a ****repeatable object file******

Only exception is for the Repeatable objects file.
